

Android Project Proposal

The title of the project will be **News**. This project will help the user to read the most updated top headlines from various news channels such as BBC News, ABC News etc. The news will be fetched from API provided by <https://newsapi.org/> using HTTPS protocol. All the responses from API will be JSON.

The project will have following features -

- 1) User can subscribe/unsubscribe to the desired news channels (A list of channels will be hardcoded).
- 2) User preferences will be saved.
- 3) User can read the complete article by clicking on it (Browser will be open).
- 4) User can share the article link using App Chooser.
- 5) User can search headlines using keyword.
- 6) User can sort the article by top, latest, popular (API will be called).

I hope the features are cleared and covering the areas which I have learned during the course.
